

Voice Page to Multiple Buildings

Provide paging to multiple buildings when the buildings are too far apart to run wire between them. Install a FXI-1 (with special "FXI1M" software) and a paging amplifier in each building and have the local telephone company provide the same telephone line to all buildings (using off premise extensions). When someone calls the line to page, all FXI-1's answer and patch the caller through to the amplifier. This diagram shows two buildings but more FXI-1's can be used to page more buildings.

The "FXI1M" software must be factory installed. Order the FXI-1 and the "FXI1M" as separate items through your Viking distributor. We install and test the custom software for a nominal fee.
